### INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No.

PCT/EP 03/11211

5. 

This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)).

(Any replacement sheet containing such amendments must be referred to under item 1 and annexed to this report.)

6. Additional observations, if necessary:

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

Novelty (N) Yes: Claims 1-15

No: Claims

Inventive step (IS) Yes: Claims 1-15

No: Claims

Industrial applicability (IA) Yes: Claims 1-15

No: Claims

2. Citations and explanations

see separate sheet

#### Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1.

The amendments filed with the International Bureau under Article 19(1) do not introduce subject-matter which extends beyond the content of the application as filed, contrary to Article 19(2) PCT. The amendments concerned are the following:

The features of former claim 3 are introduced in the independent claim 1, therefore a restriction on the subject-matter on former claim 3 was made.

Reference is made to the following documents (D1-D2):

D1: US 20020087056 A D2: US 20020102185 A

The present application meets the requirements of Article 33(1) PCT, because the subject-matter of claims 1-15 is new in the sense of Article 33(2) PCT.

2.

D1 discloses an analytic monitoring device comprising a plurality of needles adapted to pierce skin. The needle can be provided with a bevel. The needles are small-scaled with sufficient rigidity and durability. The small size also reduces the pain associated with piercing the subject's skin. The needles can be made by small-scaled molding of suitable plastics, such as polyetheretherketone (PEEK). The polymer can be filed with a reinforcing substance, such as 10-40% filled with glass or carbon fiber. (see paragr. 9,29.46,48)

3. D2 discloses needles for collecting samples coated with a synthetic resin coating of PEEK for reducing chemical adsorption on the needle's surface. PEEK is a synthetic resin having high chemical resistance and mechanical strength. PEEK is an organic material, and accordingly shows a chemical adsorptive property. In addition, PEEK shows a superior resistance to various chemicals. (see paragr. 16,17,25,26)

The idea of having reinforcement material in the polymer, which forms the needle is known from D1, such as glass or carbon fibers, but neither D1 nor D2 discloses reinforcement wires embedded throughout the length of hollow body in the polyaryletherketone polymer, which constitute the needle.

The needle itself, injection syringe, the recipient connector containing also said needle are therefore novel vis-à-vis the cited prior art

#### II) Inventive step

The subject-matter of claims 1-15 has been considered as being inventive due to the following reasoning based on the cited prior art (D1):

- 4.
- D1 represents the most relevant prior art and discloses an analytic monitoring device comprising: a plurality of needles, [...], the needles can be provided with a bevel. The needles can be made by small-scaled molding of suitable plastics such as polyetheretherketone. The polymer can be filled with a reinforcing substance, such as glass or carbon fiber. (see paragr. 9,29,48, fig 7C)
- 5.

The **problem** underlying the present application seeks to solve is the provision of a needle for injection which is not only sterile and sterilizable, but also apyrogenic and without suffering any deformation or damage to their chemical and mechanical properties, providing chemical resistance and mechanical strength.

- 6.
- The **solution** proposed in the present application is a needle made of plastic, characterized with the features of claim 1.

Another object of the present application is the provision of an injection syringe (claims 8-10) and furthermore yet another object is a connector for recipients (claims 11-15).

7.

The technical feature common to these 3 products is the needle made of a polyarylethercetone polymer (formula 1) constituted of a cylindrical body having at least one end (respectively claim 1) or both end bevelled (respectively claim 7). However this common feature is known as a feature of solutions to the same principal problem disclosed in the prior art.

## INTERNATIONAL PRELIMINARY Inter EXAMINATION REPORT - SEPARATE SHEET

International application No. PCT/EP 03/11211

8.

#### The effect:

The inventive concept is based on the combination of a chemical resistance and mechanical strength providing polymer, such as PEEK as the polymer material, which is sterilizable at high temperature maintaining the chemical and mechanical properties in combination with reinforcement wires throughout the length of the needle, which provides mechanical rigidity (for penetration into the skin).

The combination of the PEEK-polymeric material with reinforcement wires has not been suggested in the prior art and has not been obvious for a skilled person in the art in order to solve the problem posed.

Therefore the subject-matter of claims 1-15 of the present application involves an inventive step
